African Swine Fever (ASF)
Report N° 49: July 10 to 23, 2020
World Animal Health Information and Analysis Department

ASF SITUATION

The presence of ASF is notified to the OIE by its Members through the Six-monthly reports (as sufficiently stable) or through Immediate Notifications (IN’s) and Follow-up reports (FUR’s), when considered as an exceptional event. Between 2018 and 2019, this disease was notified through six-monthly reports in 4 countries in Europe (Estonia, Italy, Lithuania and Slovakia) and 23 countries in Africa1. Namibia, Nigeria, South Africa and Zambia notified the disease through the Six-monthly reports and through IN and FUR’s. This report presents an overview of the events notified through the OIE’s Early Warning System (EWS) by means of IN and FUR’s. This information is publicly available2. A classification of the affected population (by wild boar, backyard and farm swine) was made considering their different roles in the epidemiology of the disease.

1. Spatial distribution

![Figure 1. ASF outbreaks reported through the Early Warning System within the period. The outbreaks notified between July 10 and 23 are pointed with a higher color intensity compared to the ongoing outbreaks (lighter colors).](image)

In this period, 441 new outbreaks were notified. The total of ongoing ASF outbreaks worldwide is now 7,030 (including 3,542 outbreaks in Romania and 1,472 outbreaks in Vietnam). In the previous report, 603 were notified as new, while 7,030 outbreaks were ongoing.

2. Impact of the disease

Romania accounted for the majority of the losses reported during this period (11564 out of a total of 13071). Russia reported 1144 losses. In Africa Nigeria updated its report on unexpected change in the distribution or increase in morbidity or mortality of a listed disease. However, the impact is not quantifiable due to the format of these reports. Other losses were reported by Poland (169), Romania (172) and Ukraine (22).

![Figure 2. Losses* due to ASF outbreaks notified through WAHIS within the period (July 10 to July 23, 2020) [Losses in Nigeria not quantifiable].](image)

The impact of this disease is measured in terms of losses*, which are calculated by the sum of dead and culled animals from the infected farm or backyard premises of the reported outbreak.

3. Changes in the epidemiological situation

Countries/Territories with new or ongoing outbreaks in the current period:
25 Countries/Territories notified new or ongoing outbreaks through immediate notifications and follow-up reports, 10 in Europe (Bulgaria, Greece, Hungary, Latvia, Moldova, Poland, Romania, Russia*, Serbia, and Ukraine); 11 in Asia (China (People’s Republic of), India, Indonesia, Korea (Democratic People’s Republic of), Korea (Republic of), Laos, Myanmar, Papua New Guinea, Philippines, Russia*, Timor-Leste and Vietnam) and 3 in Africa (Namibia, Nigeria, and South Africa).

Africa
African swine fever has been reported as sufficiently stable in Nigeria since 2008. However, an unexpected change in the distribution, morbidity and mortality has been confirmed in May 2020. Consequently, an IN has been submitted to inform the OIE and its Member Countries. The country stated the following: “The outbreak started in February but with minimal fatality, but then, the number of mortalities increased drastically in May/June. The affected pig population are in a pig village, a large pig farm settlement that feeds several other pig markets within and outside the country. Update as of 17July 2020: The outbreak has been confirmed in two more states (Plateau and Edo States).”

Asia
A total of 14 outbreaks were notified: 4 in swine (Russia (4), and Vietnam (181), and 10 in wild boar in Korea (Republic of). Of particular interest are the two outbreaks reported in Zabăjaki Sîi Kray administrative division in Russia as they are very close to the border with Mongolia.

Europe
A total of 427 outbreaks were notified: 36 in swine (Romania (25), Russia (5), Poland (3), Latvia (2) and Ukraine (1)), and 391 in wild boar (in Hungary, Latvia, Poland, Romania and Russia). In this region, a targeted surveillance program is continuing. Often, a single case in wild boar is notified as a single outbreak, and is usually notified as resolved immediately.

Member Countries are reminded that the OIE Terrestrial Animal Health Code provides comprehensive guidance to Veterinary Authorities for establishing a country, zone and compartment free of African swine fever (ASF) as well as recommendations relating to the trade of pork and pork products. These products, when handled in accordance with hygienic practices complying with international standards, should not present a risk of infection.

The OIE also encourages Member Countries to implement enhanced national sanitary measures on waste disposal from aircrafts/vessels/passengers and enhanced on-farm biosecurity measures – including the protection of pigs from untreated swill feeding and the effective separation between domestic pigs and wild boar – and stresses the importance of OIE international standards for risk management of transboundary animal diseases (TADs) to reduce the risk of exporting disease to trading partners. For an overview on the historical distribution of the disease since 2016, please refer to the ASF report N° 1 (available in the official website of the OIE).

A summary of all Immediate Notifications and Follow-up reports submitted by countries in Asia and the Pacific updated in a weekly basis is available in the Region’s official webpage.
