The epidemiology of avian influenza (AI) is complex. The AI virus constantly evolves by mutation and re-assortment with the emergence of new subtypes causing significant threat to both animal and human health.

This report presents an overview of HPAI disease events (in poultry and non-poultry including wild birds) reported to the OIE’s early warning system by its Members in January 2020 through the World Animal Health Information System (WAHIS). The stable situations reported in the six-monthly reports by 2 countries, namely Egypt and Indonesia, are not described in this report as this data for the second semester 2019 will be collected in the beginning of 2020.

The HPAI events (new outbreaks) are reported in Table 1 (data reported through the early warning system).

### Table 1: HPAI outbreaks reported through early warning system during January 1 to 24, 2020

1. **Spatial distribution**

   ![Figure 1. New and ongoing outbreaks in poultry (January 1-24, 2020)](image1)

   In this period, 51 new outbreaks (red doths in the map) were notified in Chinese Taipei, Czech Republic, Hungary, India, Poland, Romania, Slovakia, South Africa and Ukraine in poultry. The total ongoing HPAI outbreaks worldwide is 102 (blue doths in the map) distributed in Africa (32), Asia (60) and Europe (23) (Figure 1).

2. **Impact of the disease by Region in poultry**

   During the period, a total of 418,954* animals were notified as losses in Africa, Asia, and Europe in the ongoing and new outbreaks (96,736* losses notified in December 2019 in Africa, Asia and the Americas).

   * The impact of the disease is measured in terms of losses, which are calculated by the sum of dead and culled animals from the infected farm or backyard premises of the reported outbreak. In case of non-poultry the losses correspond to the dead animals reported.

3. **Changes in the epidemiological situation**

   - **Countries/Territories with new outbreaks during the period.**

     **Africa**
     
     South Africa notified 2 new outbreak in poultry (H5N8). Ongoing outbreaks are still present in South Africa and Nigeria in both poultry and non-poultry (subtype H5N8).

     **America**
     
     No new outbreaks were reported during the period.

     **Asia**
     
     Chinese Taipei reported 24 new outbreaks (H5N2 and H5N5) in poultry, and India 1 new outbreak (H5N1) in poultry as well. China (People’s Rep. of) reported 3 new outbreaks in non-poultry (H5N6 subtype). Ongoing outbreaks are still present in Afghanistan, China (People’s Rep. of), Chinese Taipei, India and Korea (DPR) in poultry (subtypes H5N1, H5N2, H5N5, H5N6, H7N9) and by Afghanistan and China (People’s Rep. of) in non-poultry (H5, H5N6, H7N9)

     **Europe**
     
     Twenty-four new outbreaks were reported by Czech Republic, Hungary, Poland, Romania, Slovakia, Ukraine in poultry (H5N8). Poland and Germany reported 2 new outbreaks in non-poultry (H5N8). Ongoing outbreaks are still present in Czech Republic, Germany, Hungary, Poland, Romania, Slovakia, Ukraine

     **Oceania**
     
     No new or ongoing outbreaks were reported during the period.
Key messages
Since January 2020, countries from Europe are reporting HPAI H5N8 outbreaks in domestic poultry and wild birds. These are the first notifications of H5N8 outbreaks in Europe this winter. In the majority of these countries, the last occurrence of H5N8 outbreaks was in 2017, while Czech Republic encountered H5N8 for the first time in their territory. Also in Africa, HPAI H5N8 outbreaks continued to be reported from two countries. Veterinary Authorities in the affected countries have responded to contain outbreaks in poultry with stamping out measures, heightened surveillance, and recommendations to poultry owners to increase biosecurity. To date, no human cases of infection with HPAI H5N8 have been reported.

In Asia, other HPAI subtypes H5N1, H5N2, H5N5, H5N6 and H7N9 continue to cause outbreaks in a few countries.

The OIE Standards, and the transparency of reporting through the OIE’s World Animal Health Information System, provide the framework for Veterinary Services to implement effective surveillance, reporting, and controls for avian influenza. Wild bird surveillance can indicate periods of heightened risk, and at these times measures to improve on-farm biosecurity may reduce the likelihood of exposure of poultry.
