The epidemiology of avian influenza (AI) is complex. AI viruses constantly evolve by mutation and re-arrangement with the emergence of new subtypes causing significant impact on animal health and production. Some AI subtypes can be zoonotic and therefore pose major threat to human health.

This report presents an overview of HPAI disease events (in poultry and non-poultry including wild birds) reported to the OIE’s early warning system (immediate notification and follow-up reports) by its Members, as well as non-Member Countries, during the period 19 June – 9 July, 2020 through the World Animal Health Information System (WAHIS). The stable situations reported in the six-monthly reports by two countries, namely Egypt and Indonesia, are not described in this report as this data for the second semester 2019 will be collected throughout the first and second semesters of 2020.

The HPAI events (new outbreaks) are reported in Table 1.

1. **Spatial distribution**

![Figure 1. New and ongoing outbreaks in poultry (19 June – 9 July, 2020)](image)

In this period, 3 new outbreaks (red dots on the map) were notified in poultry, in Chinese Taipei, and Vietnam. The total ongoing HPAI outbreaks worldwide is 55 (blue dots on the map). They are distributed as follows: Africa (19), America (1), Europe (1) and Asia (34).

2. **Impact of the disease by Region in poultry**

During the period (19 June – 9 July), a total of 19,144 animals were notified as losses in Asia in the ongoing and new outbreaks (210,185* losses notified in the previous report).

*The impact of the disease is measured in terms of losses, which are calculated by the sum of dead and culled animals from the infected farm or backyard premises of the reported outbreak. In case of non-poultry the losses correspond to the dead animals reported.

3. **Changes in the epidemiological situation**

**Countries/Territories with new outbreaks during the period.**

**Africa**

No new outbreaks were reported in poultry and in non-poultry during the period. Ongoing outbreaks are still present in South Africa and Nigeria in poultry (H5N6 and H5N8) and in South African in non-poultry (H5N8).

**America**

No new outbreaks were reported in poultry and in non-poultry during the period. One ongoing outbreak is still present in the United States of America in poultry (H7N3) since April, 2020.

**Asia**

Chinese Taipei, reported 1 new outbreaks (H5N5) in poultry, Vietnam 2 new outbreak in poultry (H5N6). Ongoing outbreaks are still present in Afghanistan, China (People’s Rep. of), Chinese Taipei, India, Korea (DPR), Philippines and Vietnam in poultry (subtypes H5, H5N1, H5N5, H5N6 and H7N9) and Afghanistan, China (People’s Rep. of) and India in non-poultry (H5, H5N1, H5N6 and H7N9).

**Europe**

No new outbreaks were reported in poultry and in non-poultry during the period. One ongoing outbreak is still present in Bulgaria in poultry (H5N8).

**Oceania**

No new or ongoing outbreaks were reported during the period.
In the reporting period, 3 new HPAI outbreaks were reported in domestic birds in Asia involving 2 different HPAI subtypes namely H5N5 and H5N6. In addition, 81 HPAI outbreaks in poultry and non-poultry are still ongoing in America, Europe, Asia and Africa involving different HPAI namely H5, H5N1, H5N5, H5N6, H5N8, H7N3 and H7N9.

- Outbreaks of H5N1, H5N6 and H7N9 are still continuing in a few Asian countries with Vietnam reporting recurrence of new H5N6 outbreaks.
- In Chinese Taipei, H5N5 subtype has continued to be reported since September 2019
- The outbreak situation of H5N8 which was reported in European countries in poultry and/or wild birds have declined and only one outbreak of H5N8 is ongoing in Bulgaria. Ongoing outbreaks are also still continuing in South Africa. It is more likely that the source of infection in these outbreaks is contact with wild birds and followed by limited local spread.
- USA reported an outbreak of HPAI H7N3 in commercial poultry this year. The premises has an epidemiological link to another premises affected recently by low pathogenic avian influenza (LPAI) H7N3. A comprehensive epidemiological investigation and enhanced surveillance is ongoing in the affected area.

Veterinary Authorities in the affected countries have responded to contain outbreaks in poultry with stamping out measures, heightened surveillance, and recommendations to poultry owners to increase biosecurity.

The OIE Standards, and the transparency of reporting through the OIE’s World Animal Health Information System, provide the framework for Veterinary Services to implement effective surveillance, reporting, and controls for avian influenza. Wild bird surveillance can indicate periods of heightened risk, and at these times measures to improve on-farm biosecurity may reduce the likelihood of exposure of poultry.
