## Epidemiology

### Epidemiological comments

After the containment of the last outbreak, surveillance activities were intensified within the country. During the last three months post-outbreak active clinical surveillance was carried out in 2, 500 households/farms observing around 0.6 million birds. During that period, 1,451 dead birds were collected and tested for avian influenza. All the birds were found negative for HPAI (H5).

Based on the passive and active surveillance reports and laboratory verification, Nepal declares itself free from HPAI with effect from 19 December 2013.
