Epidemiology

Epidemiological comments

Additional cases in wild birds:

Case 1: A dead *Grus monacha* (hooded crane) was collected on 17 December 2014 and tested against avian influenza virus. It was confirmed on 19 December 2014 that the bird was infected with H5N8 influenza A virus. The result of gene sequencing indicated that a HA0 cleavage site of the amino acid sequence was consistent with that of highly pathogenic avian influenza virus.

Case 2: A dead *Aix galericulata* (mandarin duck) was collected on 12 December 2014 and tested against avian influenza virus. It was confirmed on 20 December 2014 that the bird was infected with H5N8 influenza A virus. The result of gene sequencing indicated that a HA0 cleavage site of the amino acid sequence was consistent with that of highly pathogenic avian influenza virus.

Movement control inside the country and stamping out are not applied for outbreaks in wild birds.

Follow-up information on the outbreak in poultry reported in the Follow-up report No.4:

There is a farm within the movement restriction zone and the status of the farm was confirmed by local laboratory (Miyazaki Livestock Hygiene Centre), according to the national guideline. Susceptible animals (birds) in the farm were tested by clinical inspection, serum antibody test and virus isolation. On 20 December 2014, the farm was proved to be free from avian influenza virus based on the results of the above confirmation tests.

Movement restrictions (3km radius of the affected farm) and shipment restrictions (3-10km radius of the affected farm) are still in place.

Source of the outbreak(s) or origin of infection

- Unknown or inconclusive

Measures applied

Applied	To be applied
<ul style="list-style-type: none"> • control of wildlife reservoirs • stamping out • quarantine • movement control inside the country • screening • disinfection of infected premises/establishment(s) 	<ul style="list-style-type: none"> • no planned control measures
Animals treated	Vaccination Prohibited
No	Yes
