Epidemiology

Epidemiological comments

On 28 December 2014, the local veterinary service in Miyazaki Prefecture received a notification from a broiler farm on an increase in the number of dead birds in one of four houses (30 birds on 28 December). The samples were sent to the laboratory of local veterinary service centre (Miyazaki Livestock Hygiene Centre). The samples from dead birds were confirmed to be influenza A virus positive by antigen-capture kits. On the same day, the centre started RT-PCR test and confirmed that the subtype was H5. Stamping-out policy was applied to the affected farm. Destruction of all the susceptible birds in the affected farm (approx. 42,000 birds) was completed in the morning of 29 December 2014. Movement restrictions are imposed on the farms within the radius of 3km of the affected farm. Shipment restrictions are imposed on the farms within the radius of 3-10km of the affected farm. The pathogenicity and N-type have not yet been identified and are going to be determined by the National Institute of Animal Health.
