Epidemiology

Epidemiological comments

An additional case in a wild bird:

A dead Anas platyrhynchos (mallard) collected on 13 February 2015 was tested against avian influenza virus. It was confirmed on 17 February 2015 that the bird was infected with H5N8 influenza A virus. The result of gene sequencing indicated that a HA cleavage site of the amino acid sequence was consistent with that of highly pathogenic avian influenza virus.

Follow-up information on the outbreak in poultry in Okayama reported in the follow-up report No.10:

On 14 February, the movement restriction was lifted since 21 days had passed without any new outbreaks after control measures including stamping out had been completed on 22 January 2015.

Source of the outbreak(s) or origin of infection

- Unknown or inconclusive

Measures applied

Applied	To be applied
<ul style="list-style-type: none"> • control of wildlife reservoirs • stamping out • quarantine • movement control inside the country • screening • disinfection of infected premises/establishment(s) 	<ul style="list-style-type: none"> • no planned control measures
Animals treated	Vaccination Prohibited
No	Yes

Diagnostic test results

Laboratory Type	Name of Laboratory	Species	Test Type	Date Results Provided	Result
Private Laboratory	Kagoshima University	Mallard	gene sequencing	17/02/2015	Positive
Private Laboratory	Kagoshima University	Mallard	virus isolation	15/02/2015	Positive
Private Laboratory	Kagoshima University	Mallard	reverse transcription - polymerase chain reaction (RT-PCR)	16/02/2015	Positive

Future Reporting

The event is continuing. Weekly follow-up reports will be submitted.
